and $SU(1,1)$ is the symmetry group for the production of squeezed light and quantum interferometry with parametric up- and down-conversion[7, 11] The generalized coherent states for such systems represent the quasi-classical states For example the $SU(2)$ coherent states are also known as atomic coherent states and are analogous to classical

Many of the symmetry transformations used in physics have a geometrical nature: translations, rotations, Lorentz boosts Some others have a more abstract character, separated from geometry, like the isospin symmetry which groups together protons and neutrons into nucleons or the color symmetry of hadrons, which governs the strong force
